# Module 1 part 3: Upgrading Windows server from 2016 to 2019

Upgrading both the dekstop and the core version. Since both part are similar at few points only one picture for both version will be included. There are also similarities with module 1.1 when the installation starts.
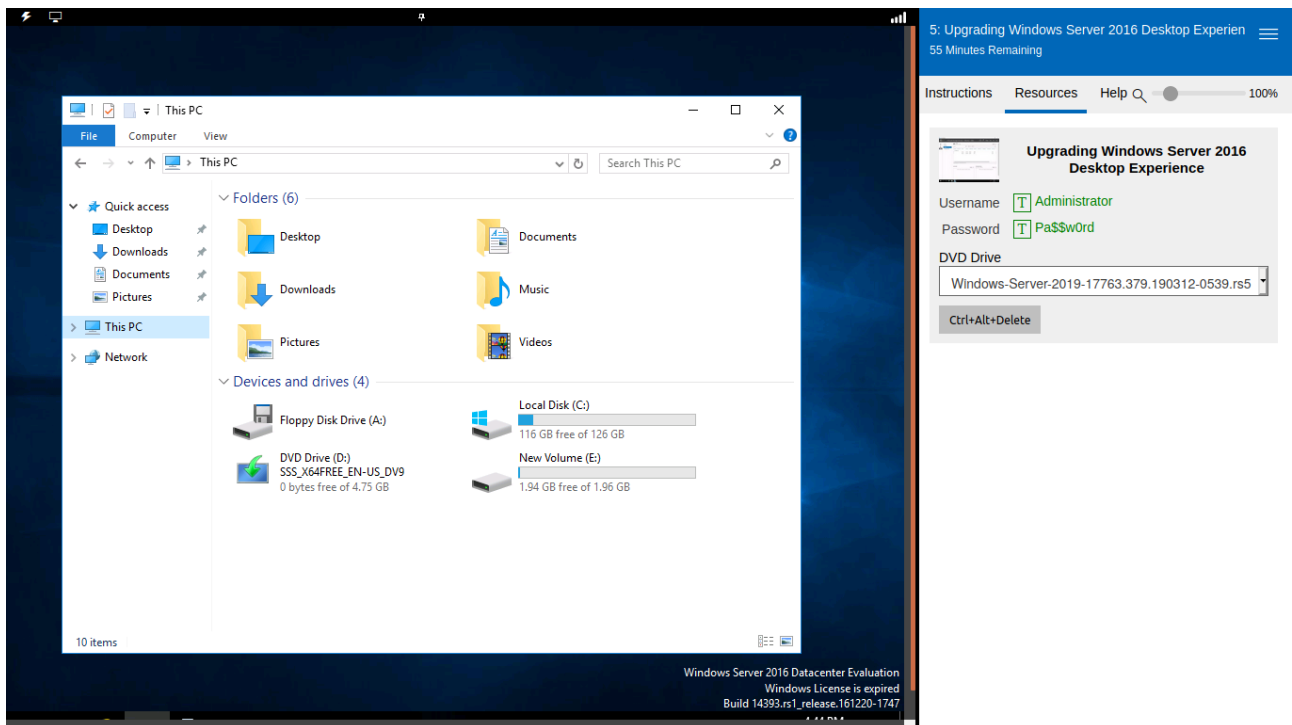

Desktop version:

Starting with creating a new volume to save som txt-files:
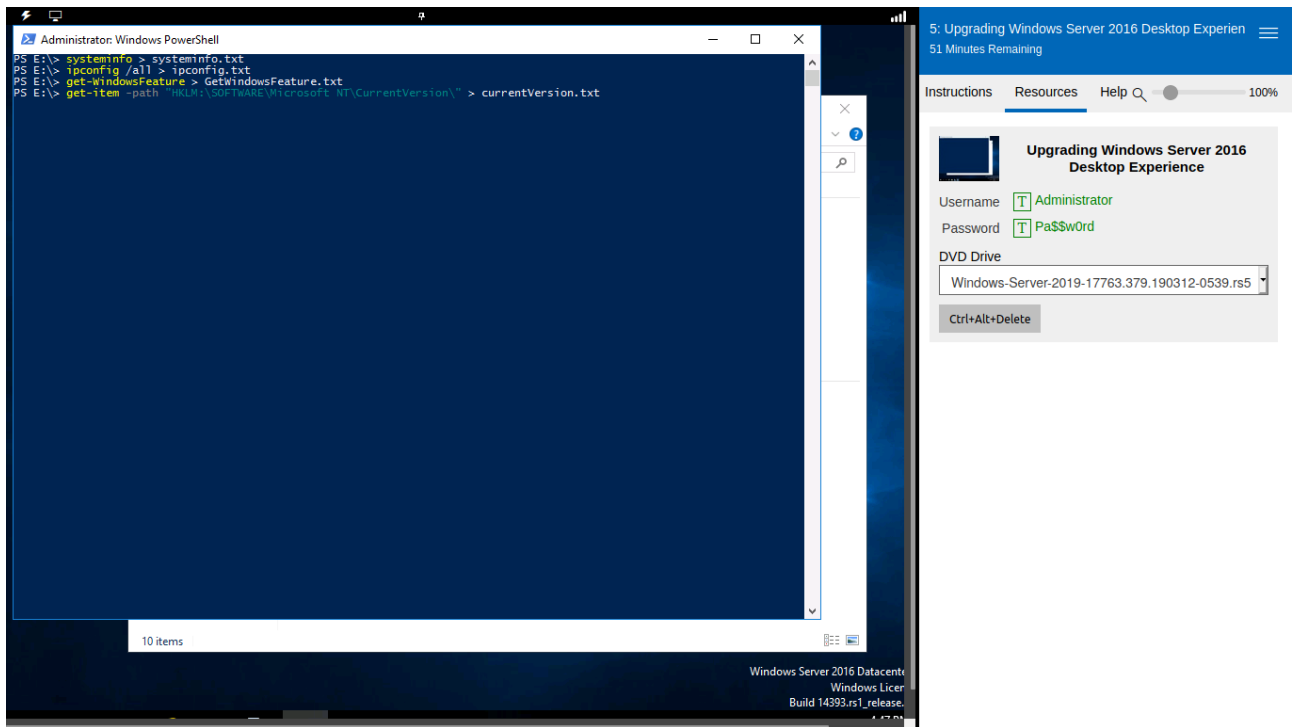

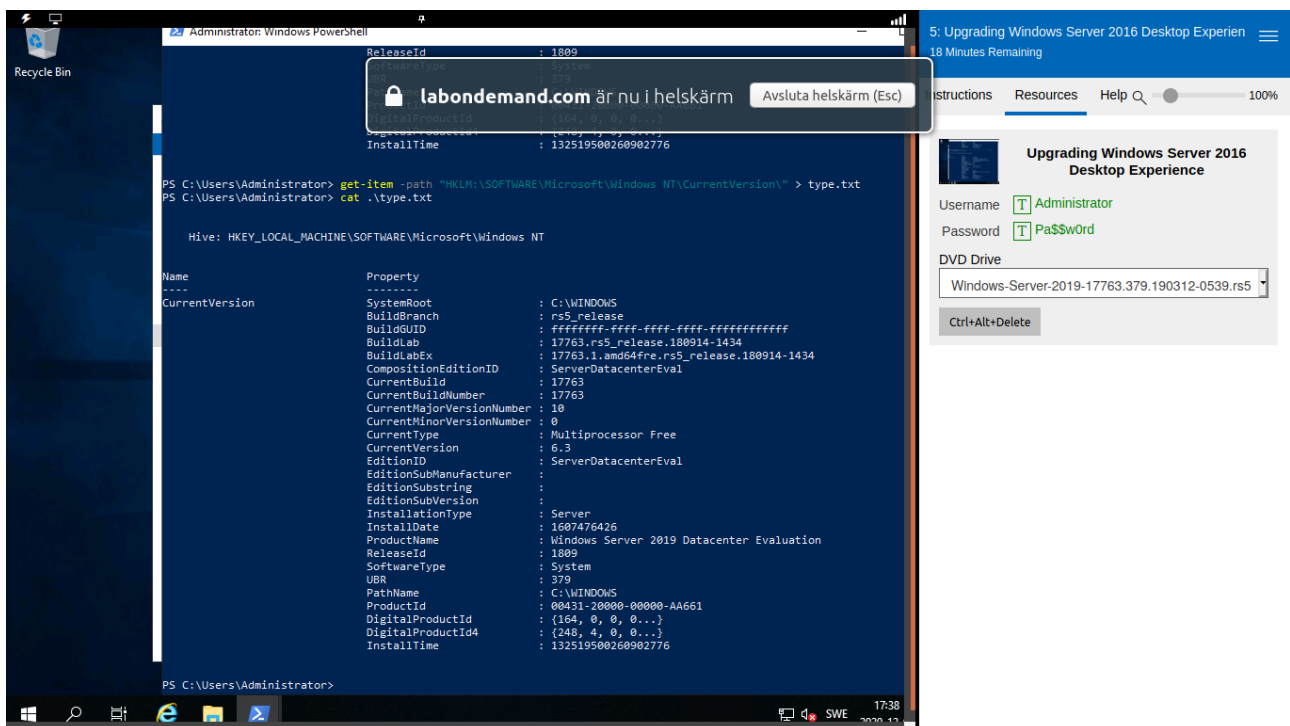

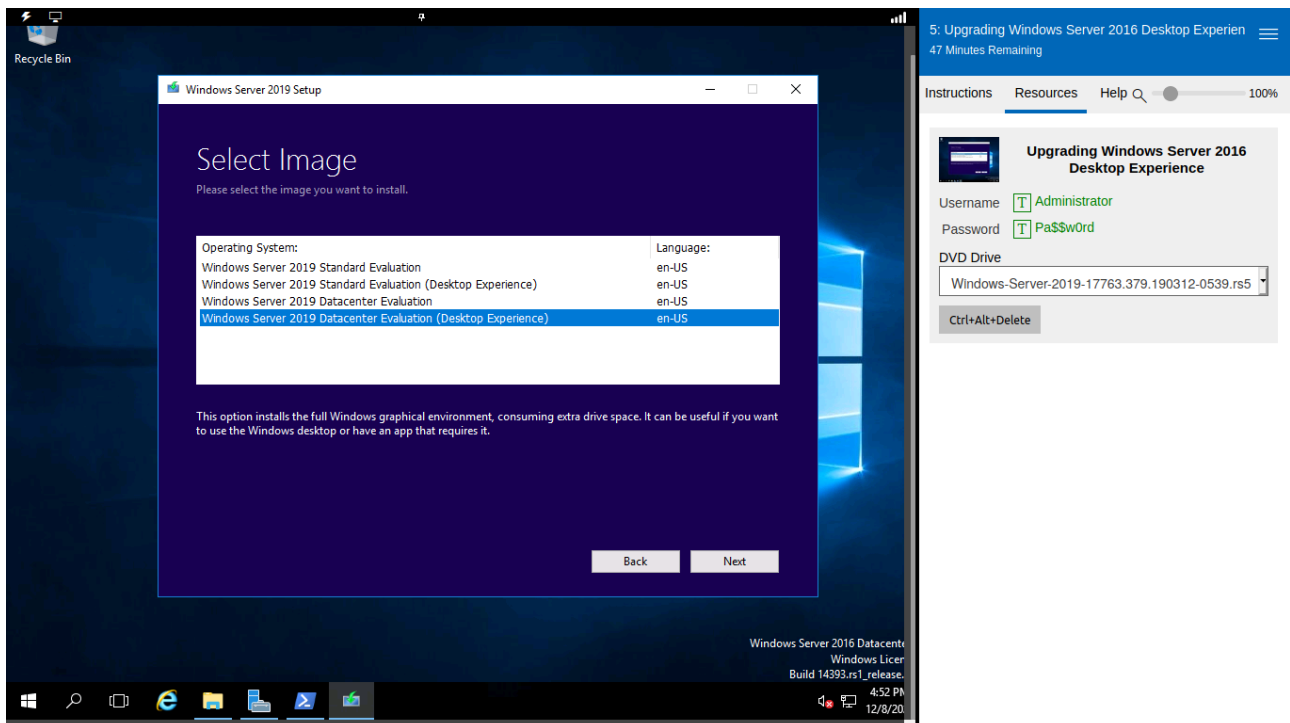

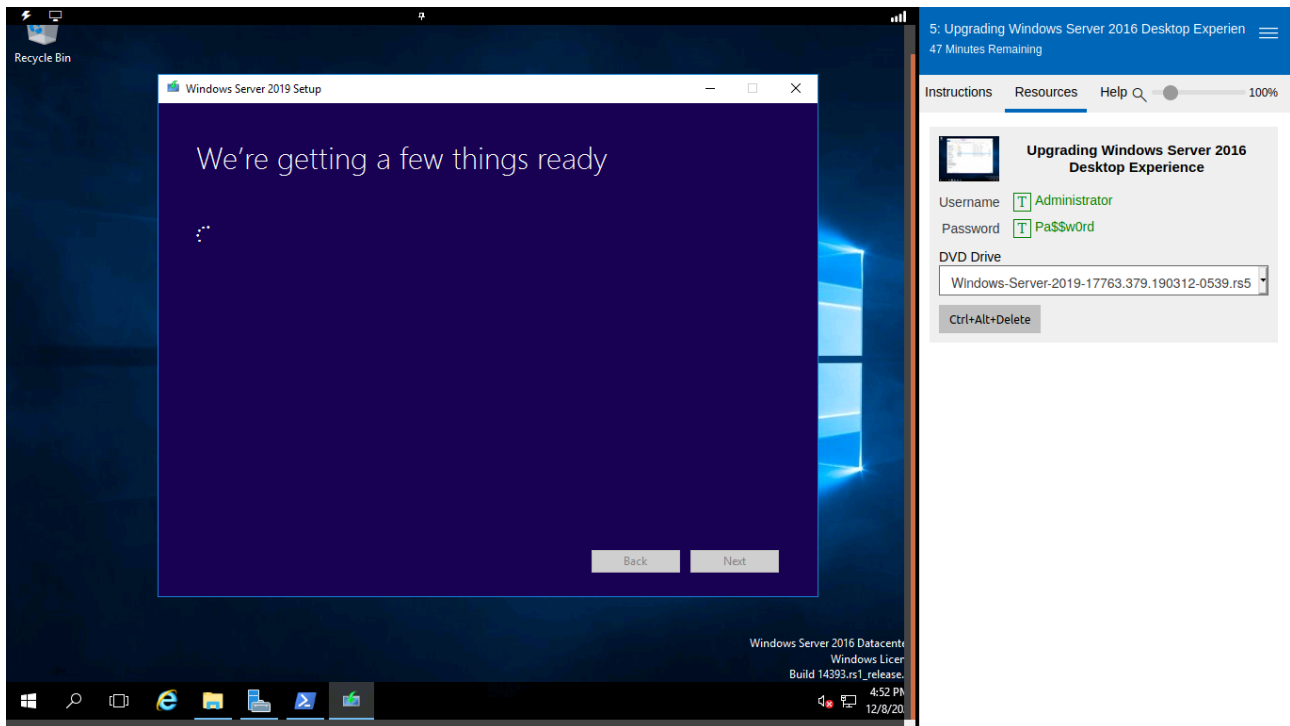

The volume E is created:

Creating the txt-files with relevant info. It should be Microsoft\Windows NT and not Microsoft NT for the last txt-file. The txt-files containes relevant settings info to use after the upgrade, since the settings will get lost. This part is the same for the core version.

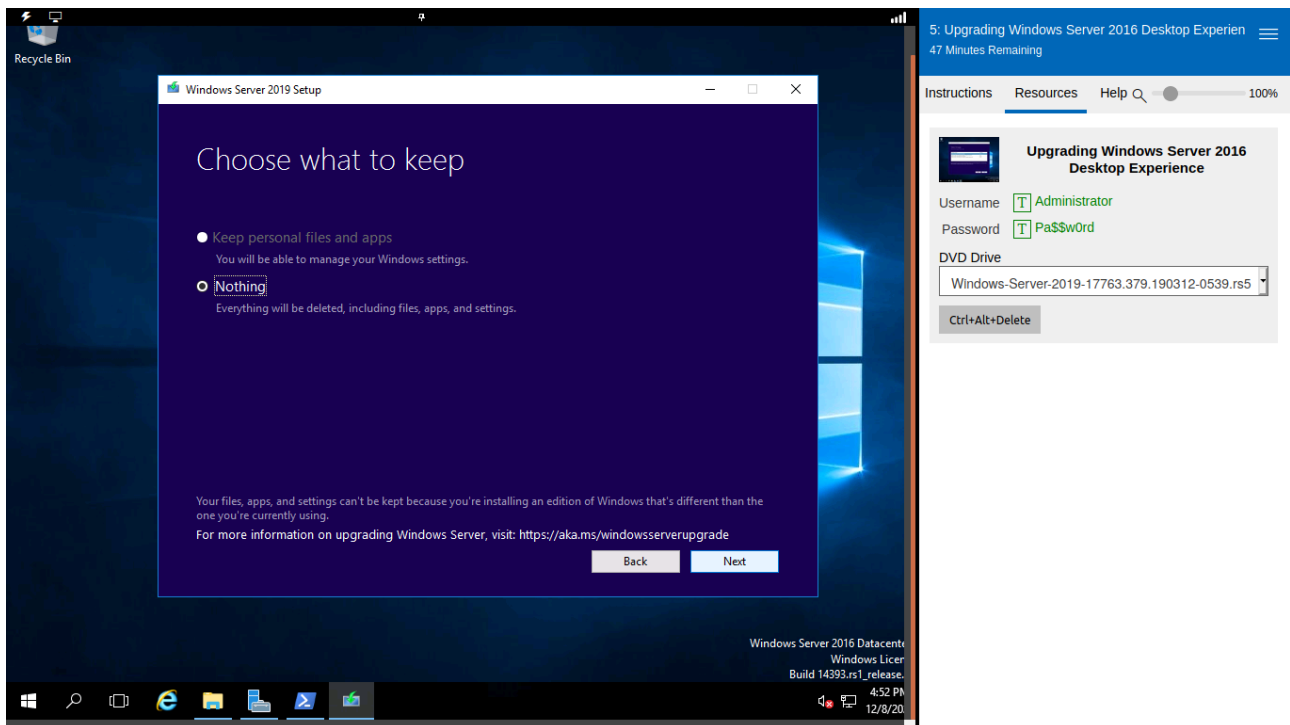

Show the txt-files with cat .\"NAME_OF_FILE"

Updating (almost the same procedure as installning):

Core version:

Creating E, then it was the same process as module 1.1:
